REPORT

TO

The Right Honourable CHARLES T. RITCHIE, M.P., President of the Local Government Board, &c. &c.

General Register Office, Somerset House,
30th November, 1887.

(1886.)

SIR,

I HAVE the honour to submit to you the following report on the births, deaths, and marriages, registered in England and Wales in the year 1886.

POPULATION.

The births and deaths registered in the year numbered respectively 903,866 and 537,276, so that the natural increment, or excess of births over deaths, was 366,590, and equal to 1·32 per cent. of the estimated population at the beginning of the year. The population of England and Wales, as enumerated in April 1881, consisted of 25,974,439 persons. The excess of births over deaths from that date to the middle of 1886 was 1,971,600; so that the population at the later date, if its growth were determined simply by the balance between births and deaths, would have been 27,946,039. This, however, takes no account of emigration and immigration; and, as there are no data for determining with accuracy the balance between these two factors, the best method of estimating the population is to assume that the rate of growth which existed in the last intercensal period has been maintained in the years that have since elapsed. On this, which is the usual, hypothesis the population of England and Wales in the middle of 1886 consisted of 27,870,586 persons, of whom 13,562,621 were males, and 14,307,965 were females. (Table I.) It is on this population that the rates in this report have been calculated.

MARRIAGES.

The marriages registered in 1886 numbered 196,071, giving a rate of 14·1 persons married to 1000 living. This is the lowest marriage-rate recorded since civil registration began. (Tables 2 and 3.) The fall in the marriage-rate was coincident, as previous reports (cf. 44th and 48th Annual Reports) have shown to have been the general rule in recent years, not only with a fall in the value per head of British exports, but also with a fall in the average price of wheat. (Table A.)

TABLE A.—MARRIAGE-RATE, BRITISH EXPORTS and IMPORTS, PRICE of WHEAT, and amount cleared at the London Bankers' Clearing House, 1860–86.*

YEARS.	Marriage-rate.	Value per Head of Population of United Kingdom.			Average Price of Wheat per Quarter.	Amount cleared at the Bankers' Clearing House per Head of Population.

1886	14·1	5 15 9	9 10 7	16 17 0	31 1	212

* The figures in the marriage-rate column are not strictly comparable with those in the value columns, inasmuch as the former relate only to England and Wales, while the latter relate to the whole of the United Kingdom. The figures relating to exports and imports are derived from the Board of Trade Statistical Abstracts; and those showing the amount cleared at the London Bankers' Clearing House are calculated upon the population of England and Wales, and are derived from the same source.

Forms of Marriage.—Of the 196,067 marriages contracted in 1886, 138,567, or 707 per 1000, were solemnised according to the rites of the Established Church, and 57,500, or 293 per 1000, otherwise. The proportions had been almost exactly the same in each of the two immediately preceding years (Table 5). Among the Church marriages there was, as had been the general rule for many successive years, a slight increase in the proportion of marriages by banns and a slight diminution in the proportion of marriages by licence.

From a table, which makes its first appearance in this Report (Table 6), it will be seen that the proportion of Church marriages to total marriages varied enormously in different parts of the country. By far the lowest proportions were registered, as might be anticipated, in North and South Wales and Monmouthshire, and the proportion was also very low, less than 60 per cent., in Devonshire, Cornwall, Durham, Northumberland, and Cumberland; while the proportions were highest, in each case above 80

per cent., in London, the extra-metropolitan portion of Middlesex, Hertfordshire, Buckinghamshire, Oxfordshire, Huntingdonshire, and Essex, or, speaking generally, in London and the immediately surrounding counties, as also in Staffordshire, Worcestershire, and the little county of Rutland.

The marriages solemnised otherwise than by the rites of the Established Church were divided in much the same proportions as in recent years; the most noticeable features being that the increase in the proportion of Jewish marriages, to which attention was directed in the last Annual Report, was continued in 1886 (Table 5), and that the proportion was higher than in any previous year.

First Marriages; Re-marriages.—Of the 196,071 men whose marriages were recorded in 1886, 171,664, or 87·6 per cent., were bachelors, and 24,407, or 12·4 per cent., were widowers. Of the 171,664 bachelors, 164,167, or 95·6 per cent., married spinsters, and 7497, or 4·4 per cent., married widows. Of the 24,407 widowers who re-married, 15,134, or 62·0 per cent., married spinsters, and 9273, or 38·0 per cent., married widows.

Of the 196,071 women whose marriages were recorded in 1886, 179,301, or 91·4 per cent., were spinsters, and 16,770, or 8·6 per cent., were widows. Of the 179,301 spinsters who married, 164,167, or 91·6 per cent., married bachelors, and 15,134, or 8·4 per cent., married widowers. Of the 16,770 widows who re-married, 7497, or 44·7 per cent., married bachelors, and 9273, or 55·3 per cent., married widowers.

As compared with the returns for 1885, the marriages of bachelors, of spinsters, of widowers, and of widows, all showed a decline.

Re-marriages of Divorced Persons.—The number of persons married in the year who were described as divorced was 163, and included 78 men and 85 women; these showed a decline of 7 from the number of divorced persons married in 1885. Of the 78 divorced men, 65 married spinsters, 8 married widows, and 5 married divorced women. Of the 85 divorced women, 59 married bachelors, 21 married widowers, and 5 married divorced men.

Ages at Marriage.—In 13,609, or 6·9 per cent., of the marriages, the ages of both contracting parties were not inserted in the register. The mean age at marriage of the remaining 182,462 couples was 28·2 years for the men and 25·9 for the women. The mean age of the widowers was 43·8 and of the widows 40·1 years; while that of the bachelors was 26·2 and of the spinsters 24·6 years. The mean ages at marriage, as was noticed in the last Annual Report, have been gradually rising since 1873, when they were at their minima, and the figures just given for bachelors and spinsters are the highest as yet recorded; but, notwithstanding this, under-age marriages are still very numerous, for no fewer than 13,079, or 8·1 per cent., of the bachelors, and 39,533, or 23·6 per cent., of the spinsters, whose marriage-ages were stated in 1886, were under 21 years of age; while in 9558, or 6·2 per cent., of the marriages between bachelors and spinsters, whose ages were stated, both parties were minors.

In the last Annual Report (pp. ix–x) some account was given of the average ages at which men marry in different ranks of life. It has been found since that report was published that, by a clerical oversight, the odd months over the fully completed years of age had not been taken into account, and that consequently the average age was under-stated in each group by six months. The table, duly corrected, is here reprinted; and to it has been added another column giving the average ages of the women at marriage with men in the same groups of occupations. The table is based

on the registered ages of bachelors and spinsters only, widowers and widows alike being left out of account.

TABLE B.—AVERAGE AGES at MARRIAGE of BACHELORS and SPINSTERS in OCCUPATIONAL GROUPS, 1884–85.

Occupations.	Bachelors.	Spinsters.	Difference between the Ages of Husband and of Wife.
Miners - - -	24·06	22·46	−1·60
Textile hands - - -	24·38	23·43	−0·95
Shoemakers, Tailors - -	24·92	24·31	−0·61
Artisans - - - -	25·35	23·70	−1·65
Labourers - - -	25·56	23·66	−1·90
Commercial Clerks - - -	26·25	24·43	−1·82
Shopkeepers, Shopmen - -	26·67	24·22	−2·45
Farmers and Sons - - -	29·23	26·91	−2·32
Professional and Independent Class	31·22	26·40	−4·82

If the two sets of figures be compared with each other it will be seen that they present a very close resemblance in their main features; for in those groups in which the men marry early, so also do the women; while in those, on the other hand, where the men postpone marriage till comparatively riper years, the wives also are more mature. Thus, the miners, and next to them the textile hands, are the groups in which the mean age at marriage is lowest both for men and for women; while the farmers and the professional and independent class come in each set of figures at the other end of the column, showing the highest mean ages both for men and for women. It is, however, noticeable, among other small points of difference between the male and female series, that while the professional and independent class are far ahead of all the other groups, farmers included, in respect of the mean age at which the men venture to marry, this is not the case with their brides, for in this respect they fall somewhat behind the farmers.

A third column in the table shows the average difference of age between the husband and wife in the several groups, and it is seen that, speaking generally, the more advanced the marriage-age, the greater is this difference. In other words, the ages of the wives in the several groups differ considerably less than do the ages of the husbands.

The marriages which served for the calculation of the mean ages in Table B. were carefully taken from all parts of the country, so that the sample might fairly represent the bulk. This precaution was absolutely necessary; for there appear to be local conditions, of which our official returns afford no explanation, that most seriously affect the age at which marriage is usually contracted in different counties. Thus, on comparing the marriages of miners for one complete year (1884) in Durham, with those of miners in Staffordshire, it was found that the proportion of under-age bridegrooms was not far from twice as high in the latter as in the former county; and, similarly, when the marriages of labourers in the two agricultural counties of Dorsetshire and Bedfordshire were compared with each other, the under-age proportion was nearly twice as high in the latter as in the former. Thus it will be seen on examining Table 8, which gives the per-centage of under-age husbands and wives in each county, that though the per-centage of the former (judged by the mean proportion in the ten years 1876–85) is very high in Leicestershire, Nottinghamshire,

Staffordshire, the West Riding, and Derbyshire, among mining and textile counties, yet it is scarcely above the average in the pre-eminently mining county of Durham; while, on the other hand, it is excessively high in Buckinghamshire, and still more so in Bedfordshire, in neither of which counties are there any miners or any notable proportion of textile hands. The local conditions or customs in these counties are apparently more potent than the occupations. As regards the marriage-ages of the wives, the county figures tally more closely with the occupational figures than do those of the men; for the counties in which on an average of ten years (1876–85) the proportions of under-age brides were highest were, beginning from the highest, Durham, Nottinghamshire, Staffordshire, Derbyshire, and the West Riding.

Signature in Marriage Register.—Of the men who married in the year, 96 per 1000, and of the women 115 per 1000, were unable to write their names, and signed the register by mark; while in 37 per 1000 of the marriages both husband and wife were alike illiterate. How great an improvement these figures imply in the diffusion of elementary education will be seen on consulting Tables 7 and 8.

Taking England and Wales as a whole, the number of men who are unable to write is considerably smaller than that of women, though the difference in this respect between the sexes is rapidly diminishing; for in 1856 there were 140 such women to 100 such men, whereas in 1886 there were but 120. But taking the counties separately there is great diversity, and the general rule, as is conspicuously visible in Table 8, is that in agricultural counties the male, and in mining and industrial counties the female, is the worse educated sex.

Buildings registered for the Solemnisation of Marriages.—The number of buildings registered for marriages by other rites than those of the Established Church, standing on the register at the end of 1886, was 9766 (Table 9), showing an increase of 173 in the course of the year, or of 1·8 per cent. on the number on the register at the end of 1885. There were also 14,818 churches or chapels in which marriages could be solemnised according to the rites of the Established Church.

Certified Places of Worship.—There were on the register at the end of 1885, 24,075 places of worship (not belonging to the Established Church), certified under Acts 15 & 16 Vict. c. 36, and 18 & 19 Vict. c. 81. During 1886, 741 new buildings were registered, while 116 were removed from the list by cancellation; thus the net increase during the year was 625, and the total number on the register on 31st December 1886 was 24,700. Doubtlessly, however, some of the buildings that stand on the register are no longer in use, for while there is a sufficient provision for the registration of all new buildings, inasmuch as the superintendent registrars receive fees for supplying the requisite information to the Registrar-General, there is no effective provision to ensure the removal from the list of such buildings as have gone out of use.

When application is made for a certificate, the applicant is called on to fill in and sign a form, in which among other particulars the precise designation of the community that purposes to make use of the building for worship is included. The great variety of such designations may be judged of from the following list, which gives the names of the several bodies that obtained certificates for additional buildings during the year 1886, and also the number of buildings certified during the year for each such body. The list, however, excludes the designations of a few sects,

in cases where, through cancellation, no increase to the number of buildings on the register occurred during the year.

Births.

The births registered in 1886 numbered 903,866, and were in the proportion of 32·4 to 1000 persons living. This is the lowest rate recorded since 1848, when the rate was also 32·4.

The rate varied from 26·7 in North Wales, 27·3 in Herefordshire, and 27·4 in Sussex, to 36·1 in Staffordshire, 36·2 in Durham, 36·8 in Essex, and 37·4 in Monmouthshire. (Table 10.) The causes of the differences presented by the registration counties in regard to their birth-rates, differences which repeat themselves with very considerable constancy year after year, have been discussed in a previous report. (42nd Annual Report, p. xiv).

Sex.—The male births numbered 460,470, and the female births numbered 443,396, the former being to the latter in the proportion of 1039 to 1000, the mean proportion in the preceding ten years having been 1038 to 1000.

Illegitimate Births.—The infants registered as born out of wedlock numbered 42,838, and were in the proportion of 1·5 to 1000 persons living, a lower rate than in any previous year (Table 2.) The proportion of births registered as illegitimate to total births was 47 to 1000, the mean proportion for the ten preceding years having been 48 per 1000. In the registration counties the proportion varied from 32 in the extra-metropolitan portion of Middlesex, 34 in Essex, and 38 in London, to 72 in Norfolk, 75 in North Wales, 79 in Cumberland, 80 in Herefordshire, and 82 in Shropshire. These differences between counties, as may be seen in Table 10, repeat themselves with much constancy.

Deaths.

The deaths registered in 1886 numbered 537,276, and were in the proportion of 19·3 to 1000 persons living. The rate in 1885 had been 19·0, and in 1881 had been 18·9, but with these two exceptions the rate in 1886 was the lowest as yet recorded. In each of the six years 1881–6 the death-rate was below 20·0 per 1000, having been above 20·0 in every other year since civil registration began. (Table 2.)

The rate ranged from 14·7 in Westmorland, 16·0 in the extra-metropolitan part of Surrey, and 16·1 in Sussex, to 21·0 in South Wales, 21·9 in Lancashire, 22·1 in Cornwall, and 23·1 in Monmouthshire.

The rate in 1886 was below the decennial average (Table 10) in most of the registration counties, and notably in the counties forming the West Midland, the North Midland, the North-Western, the Yorkshire, and the Northern Divisions of the country; but the reverse was the case in the South Midland and the Eastern Counties, as also in the extra-metropolitan part of Kent, and in Hampshire, Dorsetshire, Devonshire, Cornwall, Herefordshire, Shropshire, Monmouthshire, and South Wales.

Sex.—The male death-rate was 20·3, and the female rate 18·3 per 1000 living of each sex respectively, giving for equal numbers living 1109 male deaths to 1000 female deaths. In no year previous to 1863 did the proportion reach 1100, while in no year since that date has it failed to be above that level. There has clearly, therefore, been some condition in operation that has prevented males from sharing equally with females in the general diminution of mortality that has been so conspicuous in recent years, and the probable explanation is that more of the male than of the female mortality is due to causes that lie outside the reducing influences of sanitary measures, such causes, for instance, as violence, overwork, drink, and generally all kinds of excess.* It is worth noting, therefore, that in

* This, however, can scarcely be the complete explanation, for a careful examination of the mortality at different ages shows that the increase of male as compared with female mortality was shared by all ages, though it was far the most marked in the age-periods which would be most affected by the causes mentioned above, namely from 25 to 55 years of age.

each of the last two years, 1885 and 1886, the male mortality was lower in proportion to the female mortality than in any year since 1866; and moreover, that while in the five years 1876–80 the average proportion of male to female deaths was, for equal numbers living, 1133 to 1000, in the six years that have since elapsed the proportion has only averaged 1120.

Ages at Death.—On looking at Tables 11–13, it will be seen that, though the general death-rate both for males and females was slightly higher in 1886 than on two previous occasions, namely 1881 and 1885, yet the rate for each separate age-period from 5 to 35 years of life was the lowest on record. The mortality in the first quinquennial period, 0–5 years, was also far below the average, though higher than on three previous occasions, viz., 1881, 1883, and 1885, in each of which years there was much less summer diarrhœa than in 1886, when the diarrhœa mortality was much above the average in the ten preceding years, and in consequence the proportion of infantile deaths to births was 149 per 1000, and higher than the average of the previous ten years, in which the proportion was only 142 to 1000 (Table 10). The year 1886 then was unfavourable to infants, as it was also to persons at the other end of life, for in each age-period from 65 years onwards the mortality was very considerably above the average of recent years.

Among the deaths were 71 of reputed centenarians, 27 of whom were males and 44 were females. In 1885 and 1884 the numbers had been 63 and 58 respectively.

Urban and Rural mortality.—The terms urban and rural are somewhat vague, and the line of demarcation between the two can only be drawn arbitrarily. In Table 25 will be found stated the sense in which the terms are here used, and it will be seen that while the urban death-rate in 1886 was 20·0, the rural rate was only 18·0 per 1000 living. This difference, however, is much less than that in most previous years, for while the urban rate previously to the beginning of the current decennium had been from 22 to 26 per cent. above the rural rate, in 1881–4 the excess was only 18 per cent., and in 1885 and 1886 fell still further to 11 per cent. (Table 24), although in the latter of these two years summer diarrhœa, a specially urban disease, was more than usually prevalent. The healthiness of towns, as measured by their death-rates, appears therefore to be improving more rapidly than the healthiness of rural districts.

Registered Causes of Death.

The assigned causes of death were distributed as follows in the several classes:—

Table C.—Mortality from the several Classes of Diseases.

Causes of Death.	Total Deaths in 1886.	Rate per Million living.						
		1886.	1885.	1884.	1883.	1882.	1881.	Mean 1871–80.
Zymotic diseases	73,747	2,648	2,507	3,094	2,639	3,088	2,660	3,724
Parasitic diseases	990	35	30	38	39	37	39	57
Dietetic diseases	1,656	59	59	58	66	68	66	63
Constitutional diseases	92,751	3,330	3,276	3,404	3,407	3,395	3,328	3,594
Developmental diseases	45,103	1,618	1,598	1,574	1,632	1,558	1,582	1,674
Local diseases	276,302	9,915	9,908	9,543	9,890	9,591	9,348	9,920
Violence	17,444	626	625	651	675	669	697	736
Ill-defined and not specified causes	29,283	1,047	1,007	1,149	1,188	1,154	1,160	1,610
All causes	537,276	19,278	19,010	19,511	19,536	19,560	18,880	21,378

Zymotic or Specific Febrile Diseases.—The deaths ascribed to this class of specially preventable diseases numbered 73,747, being in the proportion of 2648 to a million persons living; a proportion, which, though not actually the lowest as yet recorded, was far below the average of the decennium 1871–80. (Table C.)

The deaths ascribed to *small-pox* numbered 275, and were far lower in proportion to the population than in any previous year. There were, however, also 93 deaths ascribed to chicken-pox; and, as this ailment is rarely if ever fatal, in all probability most or all of these deaths were really due to small-pox. Supposing this to be the case, the small-pox deaths would amount to 368, being in the proportion of 13·2 to a million living; and even this proportion was far lower than the uncorrected small-pox rate in any previous year. (Tables 16, 17, 18.)

The deaths from *typhus* were in the proportion of only 9 to a million living, a lower rate than in any previous year. In 1869, the first year in which typhus was separated from other forms of fever, the rate was 193 per million; but from that date it has fallen almost uninterruptedly, with the exception of a slight recrudescence in 1882–83, to its present low figure. This disease still, however, maintains comparative activity in some of the northern counties and notably in Lancashire and Durham; for while the annual rate per million in all England and Wales averaged 20 in the six years 1881–86, in Lancashire it averaged 77 and in Durham 63.

The deaths from *enteric fever*, perhaps the best single test of sanitary condition, were in the proportion of 182 per million living. In the immediately preceding year the rate had been 173 per million; but with this exception the rate in 1886 was the lowest recorded, and no less than 53 per cent. lower than in 1869, the first year for which the rate is known.

The death-rates from *diphtheria* and *whooping-cough* were respectively 147 and 464 per million living, and did not depart materially from the average rates in recent years.

The mortality from *diarrhœa*, under the influence of the hot weather that prevailed during the third or summer quarter (Table 35), rose to 888 per million living, having averaged only 653 in 1881–85, and 834 in the still earlier quinquennium 1876–80 (Table 17).

The mortality from *measles*, to which cause 12,013 deaths were ascribed, was in the proportion of 431 per million living, and, though not so high as in the immediately preceding year, 1885, was considerably above the average of the decennium, 1876–85, which was only 398 per million. This disease was especially fatal in the counties of Warwick, Stafford, Cornwall, Monmouth, Huntingdon, Devon, Lancaster, Northampton, and Worcester, the mortality in these several counties ranging from 800 to 600 per million; while on the other hand the rate was less than 100 per million living in Berkshire, Dorsetshire, Wiltshire, North Riding, Somersetshire, Westmorland, and North Wales.

The deaths from *scarlet fever* numbered only 5986, being absolutely, and not merely in relation to the population, fewer than in any previous year in the table (Table 15), which goes back to 1862. Indeed, with the exception of the immediately preceding year 1885, there is scarcely a year in the table in which the scarlet fever deaths were not more than twice as numerous as in 1886. Relatively to the population, the mortality was 215 per million, having been 231 in 1885, 400 in 1884, 472 in 1883, and never in any earlier year under 500 (Table 16). The highest mortalities from

this disease were in Durham, West Riding, and South Wales, in each of which the rate exceeded 400 per million, while it was less than 50 per million in Rutlandshire, Dorsetshire, Herefordshire, Westmorland, and Kent (extra-metropolitan).

In previous Reports (47th Annual Report, and Annual Summary for 1880) some account has been given of the geographical distribution of scarlet fever and also of its relations to seasons. It may be well here to examine the relations in which this disease stands to age and sex, so far as official returns throw light on the subject.

In the course of the 27 years 1859–85, nearly half a million deaths from scarlet fever were registered in England and Wales. These deaths form the basis of the following table, which gives the mean annual mortality per million living at successive age-periods, for each sex.

TABLE D.—MEAN ANNUAL MORTALITY from SCARLET FEVER per Million living at successive AGE-PERIODS, 1859–85.

Age.	Annual Deaths per Million living.	
	Males.	Females.
0–1	1664	1384
1–2	4170	3874
2–3	4676	4491
3–4	4484	4332
4–5	3642	3556
0–5	3681	3482
5–10	1667	1613
10–15	346	381
15–20	111	113
20–25	59	77
25–35	36	58
35 and upwards	13	15
All Ages	778	717

It will be seen that in each sex the mortality from scarlet fever rises to a maximum in the third year of life, and then falls, at first slowly, but afterwards rapidly, becoming smaller and smaller with each successive age-period, to the end of life.

Further it will be noted that from birth to the end of the tenth year of life, that is to say, throughout that portion of life in which by far the greater part of the deaths from scarlet fever occur, the male mortality is considerably higher than the female mortality, but that after this period the reverse is the case, the excess being in each later age-period on the side of the female sex.

Seeing on what a very large basis these rates have been calculated, both as regards number of deaths and number of years over which they were spread,* we may feel assured that the differences here pointed out between successive age-periods and the two sexes are not accidental or transitory, but fixed and permanent; and the question next to be considered is whether these differences of mortality are due to the disease being more common, or to its being more likely to terminate fatally in one sex than

* The very variable severity of scarlet fever in different outbreaks makes it necessary, for any trustworthy statistics, to take a long series of years into account.

the other, and at some ages than others. Are the differences, that is to say, differences of prevalence or differences of case-mortality?

The first step in examining this question is to ascertain the case-mortality, that is to say, the proportion of deaths to cases at each age-period and in each sex.

The data available for this calculation are neither so abundant nor so complete as could be wished. The particulars, however, as to age, sex, and results have been obtained in 17,795 cases of scarlet fever admitted during the 12 years 1874–85 into the London Fever Hospital and the Metropolitan Asylum Hospitals at Stockwell and Homerton, and the rates given in Table E. are calculated from these 17,795 cases. It was necessary, however, to supplement, to a certain extent, the information obtained from these London Hospitals; for the published reports of these hospitals do not distinguish the several years of life in the 0–5 years-period, and, as this is the period of life in which scarlet fever is at its maximum, the separation of these single years from each other is of much importance. This deficiency has been met in the following manner:—The official reports for Christiania in Norway give the full particulars of nearly 5,000 cases of scarlet fever which had occurred there in the years 1870–82. The case-mortality among these attacks for the aggregate 0–5 years age-period differed very slightly from the case-mortality for the corresponding age-period in London, and it was therefore no very great assumption to suppose that there was a corresponding degree of similarity between the case mortalities in the single years which make up the 0–5 years period. It has been assumed therefore that the case-mortality in the 1st, 2nd, 3rd, 4th, and 5th years of life in London differed from the corresponding case-mortalities in Christiania just in the same degree as did the case-mortality in the aggregate age-period, made up of those five years, and the rates given in the table for these first five years are those thus obtained.*

TABLE E.—CASE-MORTALITY.—DEATHS per 1,000 CASES of SCARLET FEVER in HOSPITALS, 1874–85.

AGE.	Males.	Females.
0–1	395	442
1–2	384	346
2–3	255	226
3–4	184	174
4–5	130	112
0–5	241	217
5–10	106	97
10–15	56	53
15–20	40	34
20–25	39	32
25–35	75	43
35 and upwards	85	65

The figures in this table are very striking, and show beyond dispute how utterly untenable is the statement made, even in some works of high medical authority, that age and sex are without importance as elements in the

* The case-mortality in Christiania for the entire 0–5 age-period was, for males 211 per 1,000 cases, while in London it was 241. For females it was 200 in Christiania and 217 in London. The case-mortalities in Christiania for the single years have therefore been raised by 14·22 per cent. for males and by 8·5 per cent. for females, to give the mortalities for London. Cf. Beretning om Folkemængden og Sundhedstilstanden i Christiania, 1882, pp. xiii–xiv.

prognosis of scarlet fever. As regards sex, putting aside the first year of life, when the cases are so few that the accuracy of the calculated case-mortality is doubtful, the danger of an attack of this disease is at every age-period considerably greater if the patient be of the male than if of the female sex. The differences due to sex are, however, as nothing in comparison with those due to age. The chance of a case proving fatal in each sex is highest in the first year of life, and then diminishes rapidly and with unbroken regularity to the end of the twenty-fifth year, after which there is again an increase of risk.

Having now ascertained, firstly, what is the mortality from scarlet fever at each age-period and in either sex, and secondly, what number of cases correspond to each such death, it is of course a simple matter to combine the two tables and calculate the number of cases at each age-period and in each sex for equal numbers living, it being, however, important to notice that the cases thus obtained will be cases of equal severity to those which form the basis of Table E., that is to say, cases fit for admission into a hospital. The results are given in the following table.

TABLE F.—ESTIMATED ANNUAL CASES of SCARLET FEVER, of EQUAL SEVERITY to those ADMITTED into HOSPITAL, per MILLION LIVING, at SUCCESSIVE AGE-PERIODS and in EACH SEX.

Ages.	Males.	Females.
0–1	4,213	3,131
1–2	10,859	11,197
2–3	18,337	19,872
3–4	24,370	24,897
4–5	28,015	31,750
0–5	15,274	16,046
5–10	15,726	16,629
10–15	6,179	7,189
15–20	2,775	3,324
20–25	1,513	2,406
25–35	480	1,349
35 and upwards	153	231

So far our course has been simple, and the results arrived at may be accepted with much confidence, though it may be admitted that it would be more satisfactory were the basis of the table of case-mortality (Table E.) enlarged so as to embrace a greater number of cases and a longer series of years. But the next stage in the inquiry becomes much more hypothetical, and the result will consequently be less trustworthy. The question to which an answer has to be sought is, whether the diminution of cases of scarlet fever in successive age-periods, shown in Table F., is merely due to the increased proportion, at each successive age-period, of persons who have already been attacked by scarlet fever and are therefore protected against a future attack, or whether it indicates a diminishing susceptibility to the infection with advance of age in those who are as yet unprotected. It would not be difficult to obtain an answer to this question if the figures in Table E represented the general case-mortality and not merely the mortality of hospital cases ; but, though scarlet fever patients are sent into hospital not only when they are severe cases, but often simply in order to separate an infectious child from the rest of the family, it cannot be doubted that on the whole the average of the hospital cases will be of more than average severity, there being notoriously a large number of scarlet fever cases in which the ailment is so slight, that it would not occur to the

parents to send the child away from home. Consequently the case-mortality as given in Table E. is almost certainly much too high; it is true for hospital cases, but not for all cases. Now there are some large towns in which returns are made of all known cases of scarlet fever, whether occurring in or out of hospitals, and, though these returns are neither of sufficient magnitude nor of sufficient certainty to afford a very secure basis, yet they afford some assistance, and judging by them we shall probably not be very far from the mark if we assume that, for every individual who is protected against future scarlet fever by an attack of equal severity to that of an average hospital case, there is another person protected by an attack of less severity. Let it be assumed then, that this is true, and then the next step can be taken; the proportion of the population that is protected at each successive age-period in each sex can be calculated, and the proportion between the cases and the unprotected population ascertained. The results of this somewhat tedious arithmetical process are given in the following table:—

TABLE G.—ESTIMATED* ANNUAL NUMBER of ATTACKS and DEATHS by SCARLET FEVER in a MILLION UNPROTECTED PERSONS of EACH SEX at SUCCESSIVE AGE PERIODS.

AGE.	Attacks.		Deaths.	
	Males.	Females.	Males.	Females.
0–1	6,779	4,887	1,668	1,386
1–2	17,758	18,723	4,220	3,916
2–3	33,065	36,480	4,832	4,647
3–4	47,385	48,874	4,801	4,657
4–5	58,906	68,036	4,095	4,036
5–10	37,524	40,423	2,100	2,060
10–15	17,332	20,817	499	567
15–20	8,365	10,508	171	182
20–25	4,714	7,972	94	130
25–30	1,491	4,585	58	101
30–35	472	787	21	26

* Estimated on the assumption stated above.

The figures in this table cannot of course claim to be more than approximate estimates. More precise results will be hereafter obtainable, when the case-mortality can be based upon a larger accumulation of data than was available for the construction of Table E., and which shall include the cases outside as well as those within hospitals. Allowing, fully, however, for this element of uncertainty as to the precise figures, we are nevertheless able to draw with much certainty the following conclusions as to scarlet fever:—

1. The mortality from this disease is at its maximum in the third year of life, and after this diminishes with age, at first slowly, afterwards rapidly. (Table D.)
2. This diminution is due to three contributory causes; (α) the increased proportion in the population at each successive age-period of persons protected by a previous attack; (β) the diminution of liability to infection in successive age-periods of those who are as yet unprotected; (γ) the diminishing risk in successive age-periods of an attack, should it occur, proving fatal.

3. The liability of the unprotected to infection is small in the first year of life, increases to a maximum in the fifth year or soon after*, and then becomes rapidly smaller and smaller with advance of years. (Table G. Cols. 1, 2).
4. The chance that an attack will terminate fatally is highest in infancy, and diminishes rapidly with years to the end of the twenty-fifth year; after which an attack is again somewhat more dangerous. (Table E.)
5. The female sex throughout life, the first year possibly† excepted, is more liable to scarlet fever than is the male sex. (Table G.)
6. But the attacks in males, though fewer, are more likely to terminate fatally. (Table E.)

Now it is sometimes said that the separation from its family of a child who is attacked by scarlet-fever is scarcely worth the trouble and expense it involves, seeing that the rest of the children, though they may escape on that special occasion, are almost certain to contract this very common disease at some future time, and may therefore as well, if not preferably, have it at once. The results, however, to which our statistical inquiry has led us, are completely subversive of such a position. They show—independently of the plain fact that a very large proportion of persons go through life without ever contracting this disease—that the longer an attack is deferred, the less likely it is to occur at all; and not only so, but that, even supposing it to occur eventually, the less likely it is to end fatally.

The deaths ascribed to *puerperal fever* were 2078, and those ascribed to *accidents of childbirth* 1799, making together 3877 deaths from parturition. This gives a proportion of 4·29 deaths to a thousand registered births of living children, the proportion in the preceding decennium 1871–80, having been 4·72. The proportion varied greatly in different registration counties, and was, as it also had been in the previous decennium, much above the general average in North and South Wales and in Shropshire. (Table 23.)

The deaths from *hydrophobia* which had risen in 1885 to 60, a higher number than in any year in our Table (Table 15), with the exceptions of 1874 and 1877, fell in 1886 to 26, and were fewer than in any year since 1869. Of these 26 deaths 10‡ occurred in London, while the remaining 16 were distributed as follows: Devonshire 1, Derbyshire 2, Cheshire 2, Lancashire 6, West Riding 5. This distribution tallied pretty closely with previous experience, Lancashire, and Cheshire being the counties that are found on an average of many years (1864–86) to have had the largest number of deaths from this disease in proportion to their populations, and the West Riding and Derbyshire also standing high up in the list. Could a census be taken of stray curs, the cause of this distribution would probably be apparent. In London, at any rate, the destruction of over 30,000 stray dogs in the nine months beginning with November 1885, and the compulsory muzzling of all other dogs in the streets, appears to have been most efficacious; for while in 1885 the deaths from hydrophobia registered in London had risen to the unprecedented number of 26, in 1886 they fell, as before stated, to 10‡; and, of these 10, 6 were registered in the first quarter, 2 each in the second and third quarters, and none in the last three months of the year.

---

* The Table does not suffice to show whether the fifth year be the year of actual maximum. For as the 5–10 year-period is not broken up into separate years the maximum might possibly be in the sixth or even seventh year.

† *See* first paragraph on p. xvi.

‡ One of these 10 deaths really occurred in 1885, but was not registered till 1886.

Parasitic diseases.—The deaths attributed to parasitic diseases were 990, and in the proportion of 35 to a million persons living; a proportion differing very little from that of the previous five years. Of these 990 deaths 810 were ascribed to thrush and 6 to other vegetable parasites; 58 to hydatids, and 116 to other animal parasites.

Dietetic Diseases.—The deaths under these headings numbered 1656, or 59 per million living. Most of these deaths were ascribed to delirium tremens or chronic alcoholism, which together caused 1392 deaths, or 49 per million living, a rate practically identical with that in the immediately preceding quinquennium (Table 17). It is noticeable that while chronic alcoholism is not vastly more common, as an assigned cause of death, in the male than in the female sex, 586 men and 459 women having according to the certificates thus died in the year, delirium tremens is six times as frequent among men as among women, the precise figures being 297 for the former and only 50 for the latter sex.

Constitutional Diseases.—These diseases caused 92,751 deaths in the year, or 3330 per million living, a proportion not far from the average in the previous five years (Table 17). The changes that occurred in 1886 in the mortality from the several diseases included in this group were all in the same direction as those of previous and recent years. Thus there was a small decline under Rheumatic Fever and other Rheumatic affections, and a larger decline under Phthisis, the death-rate from this cause being 1718 per million living, and lower than in any previous year (Table 16). On the other hand there was a further increase under Cancer, which, if the certificates are to be trusted, was 50 per cent. more common in 1886 than it was twenty years earlier; and also a slight further increase under Diabetes, which must, if again full reliance be placed on certificates as a measure of prevalence, have become nearly twice as frequent as it was twenty years back. It has, however, been pointed out in previous reports that very possibly, and in the opinion of the Registrar-General, most probably, some part of these increases, how much is uncertain, may be due to improved diagnosis and more careful statement of cause on the part of medical men.

Developmental Diseases.—The deaths of infants from premature birth numbered 13,642, and were in the proportion of 15,093 per million births of living children, the mean proportion in the preceding quinquennium, 1881–85, having been 14,185. As has been pointed out in previous reports, the proportion of premature births appears to be gradually increasing, and the figure now recorded is the highest as yet reached. The deaths from congenital malformations numbered 2343, the proportion to births scarcely differing from the average in recent years. As usual, cyanosis, imperforate anus, and cleft palate were much more common in male than in female children, while the opposite was the case with spina bifida.

The deaths ascribed simply to old age numbered 28,451, and were above the average of recent years, the increase being probably attributable to the excessively cold weather that prevailed in February and in December, cold being the special enemy of the old, as heat is of the young. The year 1886, with its hot summer and its cold winter months, was more than usually unfavourable both to old persons and to young children.

Local Diseases.—Among the many large groups of diseases comprised in this class there are three that show year by year an almost uninterrupted increase, namely, diseases of the nervous system, diseases of the circulatory system, and urinary diseases; and it will be seen, on referring to Table 16, that in 1886 the mortality under each of these was either at its maximum, or almost so.

Thus the mortality from nervous diseases, omitting convulsions, was in the ratio of 1835 deaths to a million living, a rate which had only three times been passed and once equalled in the previous 24 years, for which figures are given in the table (Table 16). Is the mortality from these diseases really increasing, or can the apparent increase be accounted for on the hypothesis of transference from other headings? If we take the five years 1861–5, and the five years 1881–5, we find that the mean annual mortality in the former period was 1546 per million living, while in the latter it was 1798 per million living.

There have been some slight changes of classification within the group, but not any that will have seriously affected the group as a whole, so that it appears that of a million persons living at each period, 252 more were certified to have died annually from nervous diseases in 1881–5 than was the case 20 years earlier. Examining carefully the ages of those who died, we find that of these 252 extra deaths 112 were deaths of children under five years of age, 47 were deaths of persons over five but under 65 years, and 93 were deaths of persons over 65 years of age. The increase then has been almost exclusively at the two extreme ends of life, and one cannot but suspect that much of the apparent increase under the heading Nervous Diseases may have been due to the simultaneous decrease under the heading Convulsions, which has added to the deaths in the 0–5 years period, and to the diminution under the heading Old Age, which has added to the deaths in the 65 years and upwards period; for had the increase been real and not in great part only apparent, had, that is, fatal nervous diseases been really largely increasing, the natural expectation would be that the increase would have affected all ages in much the same degree, and not have been confined almost exclusively to early childhood and advanced life.

The deaths from diseases of the circulatory system in 1886 were 1625 per million living, having been 1597 in 1885, and these two rates are the highest as yet recorded. Here again the question arises, whether the increase may not be due to transference from such headings as Debility, Old Age, and the like. A comparison of the age-tables for 1881–5 with those of 1861–5. renders it not improbable that such may be at any rate in part the case. For the increase in the mortality from this group of diseases has not been by any means equally divided between all ages, but has been far most marked among persons of advanced age. Thus the rate has remained practically unchanged for persons under 25 years of age; for persons over 25 but under 65 it has gone up 35 per cent.; while for persons above 65 it has increased by no less than 80 per cent.

The mortality from urinary diseases was in the ratio of 445 per million living, a ratio almost the same as in each of the three next preceding years, which are the only years in which it has reached as high as 400. In the course of the 25 years included in the table (Table 16) the registered mortality in this group of diseases has almost doubled. Again, however, the diminution of deaths under such headings as Dropsy has to be kept in mind.

It is of course very annoying to the student of mortality statistics, and not less so to those who are charged with their preparation, when they would make comparison between the past and the present, to be met at almost every step by this necessity of making allowance, and that to an uncertain amount, for the possibility of transference from one heading to another, and the very efforts made to improve the quality of these annual statistics by obtaining further information as to vaguely certified cases, and by inducing medical men to be more careful and precise in statement of cause, add somewhat to the difficulty in question; for the numbers under the more definite headings are thus gradually increased at the expense of the vaguer headings. It is useless, however, to shut our eyes to the imperfections of our records. To be without trustworthy means of comparison is doubtlessly an evil, but to ignore the

difficulties and to deal with the records as thoroughly reliable would be still worse, for it is far better to be without statistics at all than to be misled by false ones.

It is to be hoped that at some future period, when all medical men shall have become more alive to the value of accurate statistics of disease, and shall have realised that to give a false or careless certificate is not only to neglect their legal duty but to do their best to retard the advance of their own science, it may be possible for the Registrar-General to put out figures that will allow serial comparison to be made without risk of error, but to judge from the character of a considerable fraction of the medical certificates at the present date that time would seem to be as yet remote.

Violence.—The deaths from some or other kind of violence numbered 17,444, being 626 to a million persons living, a proportion almost identical with that recorded in the previous year.

The deaths from suicide, however, which numbered 2254, 1694 being of males and 560 of females, were more numerous in proportion to the population—80 per million—than in any earlier year with the exception of 1879, when the rate was also 80 per million.

On the other hand, the deaths ascribed to accident, 14,860 in number, were fewer in proportion to the population than on any previous occasion. In 1865 the accidental deaths were 735 per million living, but from that date the ratio has fallen almost uninterruptedly, until in 1886 it reached 534.

The fall in the mortality from homicide, which includes all cases in which a coroner's jury has returned a verdict of murder or of manslaughter, has been even more striking, for in 1866 the ratio of these deaths was 22 to a million living; but it has fallen gradually until in 1885 and 1886 it reached its present minimum of 11 per million, so that the rate fell 50 per cent. in the course of 20 years. Of these deaths from homicide, 311 in number, 171 were cases of murder, and 140 were cases of manslaughter. Nearly half the murders, 81 out of the 171, were cases of infanticide, that is murders of children in the first year, and generally the first month, of life; and more than 10 per cent. of the deaths ascribed to manslaughter were also deaths of infants. Taking the two together, and basing the calculation upon the records of 29 years, we obtain the following annual rates of death from homicide at successive age-periods, the rates being to a million living, with the exception of the line relating to infants under one year, where the rate is to a million registered births.

TABLE H.—DEATH-RATES FROM HOMICIDE PER MILLION LIVING at groups of ages, 1858–86.

	Per Million Births.	Per Million Living.										
AGES.	0–1	All Ages.	0–5	5–10	10–15	15–20	20–25	25–35	35–45	45–55	55–65	65 and upds.
Males - -	183	19	53	4	5	9	18	19	21	19	17	17
Females -	189	13	54	3	2	3	6	9	11	10	7	9

It will be noted that in infancy and childhood, to the end, that is, of the 10th year of life, there is practically no difference in the liability of the two sexes to death from homicide; but that after this throughout life males are very much more liable than females, as might be anticipated. In each sex the liability is far highest in infancy, and lowest in childhood, increasing after this to the 35–45 years period, and then slightly and gradually declining.

There remain for consideration deaths by execution. In 1886 19 persons died at the hands of the hangman, this being a larger number than in any year since 1877. Of these 19 persons who forfeited their lives, 18 were men and only one a woman; and, as is shown by the following table to be the general law, the greater part of these criminals were persons in the earlier and more turbulent half of ordinary life.

TABLE I.—SEXES and AGES of PERSONS EXECUTED in the 29 Years 1858–86.

AGES.	15—	20—	25—	35—	45—	55—	65—	75 and upwds.	TOTAL.
Males - -	22	82	135	74	35	12	3	0	363
Females -	0	0	10	8	2	1	1	0	22
PERSONS -	22	82	145	82	37	13	4	0	385

In these 29 years, 1858–86, in which 385 murderers were hanged, there were 10,823 deaths in which coroners' juries found verdicts of murder or of manslaughter, giving one person hanged to 28 acts of criminal homicide. If cases of simple manslaughter be omitted and the ratio calculated from murders only, we can only go back as far as 1863, for no separation of murder from manslaughter was made in the Registrar-General's Reports earlier than that year. In these 24 years, 1863–86, 331 persons were hanged, while there were 5116 verdicts of murder; or one criminal was punished by death to 15·5 recognised murders.

Ill-defined and not specified Causes.—The deaths classed in this unsatisfactory group were 29,283, or 5·5 per cent. of the whole. The number would have been still higher had not between two and three thousand letters been sent out from the department to medical men asking for further information than was given in their certificates. The information received in answer to these inquiries reduced the deaths under dropsy from 966 to 336, adding, of course, the balance to heart diseases, kidney diseases, and liver diseases. Similarly an addition was made of 202 deaths to childbirth and puerperal fever, of 148 deaths to violence, and of 472 deaths to other headings.

Certification of the Causes of Death.—During the year 1886 the causes of 490,264 or 91·3 per cent. of the 537,276 deaths were certified by registered medical practitioners; and the causes of 28,690, or 5·3 per cent., were certified by coroners after inquest. The causes of 18,322 or 3·4 per cent. of the total deaths were not certified, the proportion of uncertified deaths having steadily declined from 4·7 per cent. in 1879 to 3·5 per cent. in 1885. The proportion of uncertified deaths varies very considerably in different parts of England and Wales. In the Metropolis the proportion in 1886 did not exceed 1·1 per cent. Excluding the extra-metropolitan parts of Middlesex and Surrey, the per-centage ranged from 1·2 in Wiltshire, 1·3 in Buckinghamshire, 1·7 in Monmouthshire, and 1·8 in Sussex and in Hampshire, to 5·6 in Durham, 6·0 in Cornwall and in Huntingdonshire, 6·3 in Herefordshire, and 8·1 in Wales. The high per-centage in Wales showed, however, a further considerable decline from still higher per-centages in recent years.

Progress of Registration.

The number of names added during 1886 to the printed alphabetical indexes of births, deaths, and marriages recorded in the national register of England and Wales was 1,833,284. At the close of the year the aggregate number of names in these indexes, which then embraced a period of 49½ years, was 73,937,736. The total number of searches in 1886 (excluding those in non-parochial and other records) was 35,355, showing a decline of 338 from the number in the previous year. The number of certificates issued was 26,706, and 997 fewer than in 1885. The amount received as fees for searches and certificates in the year 1886 and paid into Her Majesty's Exchequer was 5,168*l.* 16*s.* (Table 27.)

A list of the various public registers and records lodged in the General Register Office, Somerset House, was published in the 34th Annual Report, pp. xxi–xxii and xxv–xxvi.

Mortality in the Army.*

The average strength of the Army, at home and abroad in 1886, was 203,805 and the deaths were 2,813, so that the rate of mortality was 13·8 per 1,000, and corresponded with the rate in 1885. The mortality in the army abroad was 20·0 per 1000, having averaged only 15·2 in the preceding five years; while the rate at home was only 7·2, and slightly below the rate in the five preceding years, in which it had averaged 7·8. (Table 30.)

Mortality in the Navy.†

The total force in the Service afloat in 1886 corrected for time, was 46,770. The deaths were 322, being in the ratio of 6·88 per 1000. Of the 322 deaths, 236 were due to disease, and 86 to violence; so that the death-rate from disease was 5·04 and from violence 1·84 per 1000.

Of the 86 violent deaths, 48 were from accidental drowning, 32 from other accidental causes, and 6 from suicide.

Births and Deaths of British Subjects at Sea.

Marine Register Book.—In accordance with the Births and Deaths Registration Act of 1874, commanding officers of British ships not in Her Majesty's service, are required, under a penalty, to transmit returns of all births and deaths occurring on board their ships to the Registrar-General of Shipping and Seamen, who furnishes certified copies of such returns to the Registrars-General of England, of Scotland, and of Ireland. Returns of a similar character are also received from the commanding officers of Her Majesty's ships. These certified copies of entries of births and deaths at sea constitute the "Marine Register Book." During the year 1886 the entries added to this Register related to 282 births and to 3937 deaths. Of these 3937 deaths, 1484 were of persons returned as of English origin, while 482 were indefinitely returned as of persons of "British" origin; of the latter number it is impossible to estimate correctly the proportion belonging to England and Wales.

Among *passengers* on board merchant vessels at sea (Table 33), 172 births and 515 deaths were reported in 1886; these numbers showed an increase of 31 births upon the number in 1885, while the deaths showed a decline of 83.

---

* From returns furnished by His Royal Highness the Commander-in-Chief.

† From data supplied by the Director-General of the Medical Department of the Navy.

Mercantile Marine.—The Registrar-General of Shipping and Seamen reports (Table 32), that the number of merchant seamen afloat in registered vessels during 1885 was 198,781, showing a slight decline from the numbers in the two previous years. The reported deaths from all causes among these merchant seamen during the year 1885 were 3286, and give an annual rate of 16·5 per 1000 of the strength; this rate was lower than in any previous year since 1852. The reported number of seamen afloat in 1886 was 205,478, and showed a marked increase upon the numbers in recent years, but the return of deaths for that year has not yet been received.

International Vital Statistics.

In Tables 40–57 will be found international vital statistics relating to most of the principal European States, in addition to the United Kingdom. Table 40 affords the means for comparing the marriage, birth, and death-rates in each State in a series of years, with the mean rate during the period 1861–80. Tables 41–57 give detailed statistics for the United Kingdom, and for the other European States.

The *marriage-rates* in 1886 showed a further general decline from the rates recorded in recent years; the rates in Austria and the Netherlands, however, exceptionally showed an increase. The rates in the countries furnishing returns ranged from 13·1 in the United Kingdom and in Norway, to 15·5 in Austria, 15·6 in Italy, and 15·8 in the German Empire.

The *birth-rates* showed a further general decline (which was most marked in Italy), but the rates in the German and Austrian Empires, and in the Netherlands, had slightly increased. The rates in the various states ranged from 23·9 in France, 27·5 in Switzerland, and 29·6 in Belgium, to 37·1 in the German Empire, and 37·7 in the Austrian Empire.

The *death-rates* did not show any considerable variations from those recorded in the preceding year, excepting only a marked increase in Italy, namely from 26·6 to 28·3. The mean death-rate in 1886 in the nine Continental States furnishing returns was 25·5 (against 25·0 in 1885), and exceeded the rate in the United Kingdom by no less than 6·5 per 1000. The rates in the various states furnishing returns, ranged from 16·1 in Norway, 18·2 in Denmark, and 19·0 in the United Kingdom, to 26·2 in the German Empire, 28·3 in Italy, and 29·2 in the Austrian Empire.

I have the honour to be,

Sir,

Your faithful Servant,

BRYDGES P. HENNIKER,

Registrar-General.

Remarks on the Meteorology of the Year 1886.*

By James Glaisher, Esq. F.R.S., &c.

The following remarks, both with regard to atmospheric pressure and temperature, are based on the observations made near London, but they may be taken as having a general application.

Atmospheric Pressure.—The readings of the barometer were generally below their averages till February 3rd, particularly so on or about January 13th, when the weather was stormy with high wind; the average daily deficiency of pressure to February 3rd was 0·29 in.; from February 4th to 27th the pressure was generally above the average, the mean daily excess was 0·23 in.; from February 28th to March 6th, there was a mean daily deficiency of 0·42 in.; then for a week to March 14th there was an average daily excess of 0·25 in.; from March 15th to April 11th, there was an average daily deficiency of 0·08 in.; from April 12th to May 9th, the readings were generally high, the mean daily excess being 0·18 in.; then to the 18th, the mean daily deficiency was 0·19 in.; from May 19th to June 5th, the daily readings differed very little from their averages; from June 6th to the 13th there was a slight deficiency of 0·10 daily; then for 28 days to July 11th, there was a mean daily excess of 0·11 in.; from July 12th to August 2nd there was a mean daily deficiency of 0·16 in.; from August 3rd to September 3rd the pressure was variable, being chiefly above the average for these 31 days, the mean daily excess was 0·05 in.; from September 4th to 12th there was an average daily deficiency of 0·1 in.; from September 13th to October 8th the pressure was generally above the average, the mean daily excess was 0·08 in.; from October 9th to 20th the readings were low, the average daily deficiency was 0·42 in.; for the 14 days ending November 3rd, there was an average daily excess of 0·24 in.; from November 4th to 17th, the readings were low, the mean daily deficiency being 0·45 in.; from November 18th to 28th the readings were high, the excess averaging 0·56 in. daily, and from November 29th to the end of the year, the atmospheric pressure was generally below its average, the average daily deficiency for the 33 days ending December 31st, was 0·28 in. On the 8th and 9th of December the readings were nearly 1·4 in. below their averages; see remarks in Report for the Quarter ending December 31st.

The highest reading of the barometer in the year at the height of 150 feet above the sea was 30·55 ins. on February 8th, and the lowest was 28·14 ins. on December 9th; the yearly range was 2·41 ins.

Temperature.—Till the 5th of January the mean daily temperature was above its average, the mean daily excess was 6°·6; on the 6th a cold period set in and continued with but few exceptions till March 18th, the mean daily deficiency for these 72 days was 6°·0. From March 19th to April 6th it was warm, the mean excess for these 19 days was 4°·8; from April 7th to May 4th the weather was changeable, being sometimes warm, but generally cold, the mean deficiency of daily temperature for these 27 days was 2°·2, from May 4th to 10th, it was warm, the average daily excess of temperature was 4°·9. On May 11th a cold period set in and continued with a few exceptions to June 24th, the average daily deficiency of temperature of these 45 days was 2°·7; from June 25th to July 7th the weather was warm, the average excess of daily temperature was 4°·1; from July 8th to August 21st, the weather was mostly cold; the exceptions were July 18th to 22nd and August 6th to 9th, the average

* For Meteorological Tables, *see* pp. lxiv–lxix.

daily deficiency of these 45 days was 1°·6. On August 22nd a period of warm weather set in and continued with slight exceptions to September 14th, the mean daily excess being 4°·8; from September 15th to 26th was cold, the deficiency of temperature was 2°·1 daily; from September 27th to October 12th the temperature was above its average by 4° daily; from October 13th, to October 18th, the average daily deficiency was 0°·8; from October 19th to November 21st, with the exception of the 5 days, November 6th to November 10th was warm, the average daily excess of temperature of these 34 days was 1°·7; from November 22nd to December 5th was cold, the mean deficiency of daily temperature was 4°·1; the weather was warm on the 10 days ending December 15th, the mean excess of daily temperature being 2°·5; and from December 16th to 31st the weather was cold, the mean daily deficiency was 5°·3.

The highest temperatures of the air in the year were 90°·2 at Osborne, 89°·8 at the Royal Observatory, and 89°·0 at Salisbury; and the lowest were 4°·2 at Carlisle, 7°·0 at Barnet, and 9°·0 at Hull.

Rainfall.—The fall of rain was above its average in January, somewhat below in February and March. The total fall in these three months at Greenwich was 5·38 ins., being 0·41 in. above the average. The fall was below its average in April, above in May, and somewhat below in June. At Greenwich the total fall in these three months was 5·93 ins., being 0·14 in. above the average. The falls of rain in July were very near their averages, and below in August and September. At Greenwich the total fall in these three months was 4·87 ins., being 2·46 ins. below the average. The falls of rain were below their averages in October, and above in November and December. At Greenwich the total fall for these three months was 8·03 ins., being 0·91 in. above the average. The total fall of rain in the year was 24·21 ins., being 1·03 in. less than the average, and the number of days on which it fell was 163.

The heaviest falls of rain in the year at our stations were at Stonyhurst 52·89 ins., at Guernsey 45·21 ins., and at Barnstaple 45·05 ins.

The least falls were at Lowestoft 22·28 ins., at Somerleyton 23·50 ins., and at Blackheath 23·82 ins.

The greatest number of days of rain was 237 at Nottingham, 228 at Guernsey, and 226 at Burslem; and the smallest number of rainy days was 146 at Blackheath, 154 at Barnet, and 158 at Somerleyton.

Thunderstorms occurred on 57 days at the different stations during the year; of these 9 took place in October, 7 in each of the months of January, April, May, and December, 5 in July, 5 in September, 4 in August, 3 in June, 2 in March, 1 in November, and no thunderstorms were reported in February.

Thunder was heard but lightning was not seen on 47 days during the year; 8 were in each of the months of April and October, 7 in May, 7 in June, 6 in July, 6 in August, 2 in each of the months of September and December, 1 in March. None in the months of January, February, and November.

Lightning was seen but thunder was not heard on 48 days during the year; 11 of which were in October, 9 in December, 7 in September, 5 in January, 4 in June, 3 in each of the months of March, May, and August, 1 in July, 1 in November, and none in February.

Solar halos were seen on 76 days during the year; 13 of which were in April, 12 in May, 10 in each of the months of June and October, 6 in each of the months of March, July, and August, 4 in September, 4 in December, 2 in January, 2 in November, and 1 in February.

Lunar halos were seen on 40 nights during the year; there were 10 in December, 6 in January, 5 in each of the months of October and November, 3 in each of the months of March, April, and May, 2 in February, 2 in September, and 1 in June.

Auroræ boreales were seen on 3 nights during the year; there were 1 in January, 1 in March, and 1 in April.

Snow fell on 102 days during the year; 27 in January, 22 in December, 20 in February, 18 in March, 8 in April, 5 in May, and 2 in November; the day of last fall in the spring was May 26th, none fell in June, July, August, September, or October; the first fall in the autumn was on November 6th at Bradford.

Hail fell on 97 days in the year, 21 in December, 15 in January, 11 in April, 9 in November, 8 in March, 7 in each of the months of February and May, 6 in August, 6 in October, 3 in June, and 2 in each of the months of July and September. The fall on December 26 was general and was heavy.

Fog prevailed on 167 days in the year; on 22 days in January, 18 in February, 18 in October, 17 in each of the months of March and December, 15 in August, 15 in November, 12 in April, 10 in September, 9 in May, 8 in June, and 6 in July.

PRELIMINARY TABLES.

TABLE **1.—Population** of the **United Kingdom estimated** to the **middle** of **British Seas,** and of the **portions** of the **Army,**

YEAR.	UNITED KINGDOM. AREA 77,143,938 ACRES.			ENGLAND AND WALES. AREA 37,239,351 ACRES.		
	Persons.	Males.	Females.	Persons.	Males.	Females.
1838	25,903,697	12,651,465	13,252,232	15,287,699	7,479,021	7,808,678
1839	26,200,106	12,796,609	13,403,497	15,514,255	7,586,593	7,927,662

* The prices of coal in 1853–81 are derived from a Parliamentary Return (No. 225, 1881) furnished by the Registrar of the London Coal Market, by order of the House of Commons: the quotations for 1882–6 are the means of the four quarterly averages. The quarterly averages were from time to time supplied to the Registrar-General by Mr. Richard Meade, of the Mineral Statistics Department, Home Office.

† Derived from Returns, published by the Local Government Board, of the number of persons in receipt of Relief on the last day of each week.

TABLE **34.**—ENGLAND.—**Changes** in the **Constitution** of **Registration Districts** and **Sub-districts** during the Year **1886.**

N.B.—(1.) The Name of the District is in SMALL CAPITALS, that of the Sub-district in *Italics*.
(2.) The Populations quoted are the Numbers enumerated at the Census of 1881.

No. of District.	NAME OF REGISTRATION DISTRICT.	Date of Change.	Nature of Change.
		1886.	
146	BUCKINGHAM - -	1 April -	The sub-districts of this district were reduced from three to two. The sub-district of *Leckhampstead* was dissolved and the fourteen parishes formerly comprised therein (aggregate population 3,631), together with the parish of Buckingham (population 3,585) were constituted the sub-district of *Buckingham* (aggregate population 7,216). The remaining five parishes belonging to the former sub-district of *Buckingham*, viz., Padbury, Adstock, Addington, Steeple Claydon, and Middle Claydon (aggregate population 2,093) were added to the sub-district of *Tingewick*.
147	HENLEY - - -	1 April -	The sub-districts of this district were increased from two to three. The parishes of Eye and Dunsden, and Caversham (population 4,446) were transferred from the sub-district of *Henley* and constituted the new sub-district of *Caversham*, and three other parishes, viz., Ipsden, Nuffield, and Nettlebed (population 1,571) were transferred from the sub-district of *Henley* to that of *Watlington*.
181	NEWMARKET - -	1 February -	The sub-districts of *Bottisham* and *Newmarket* were united under the name of *Newmarket* (aggregate population 10,061).
214	WOODBRIDGE - -	1 April -	The parishes of Bromeswell, Melton, and Ufford (population 2,164) were transferred from the sub-district of *Carlford* to that of *Woodbridge and Wilford*.
284	SOUTH MOLTON - -	1 January -	The sub-district of *Chulmleigh* (aggregate population 4,083) was dissolved, three parishes, viz., Cheldon, Meshaw, and East and West Worlington (aggregate population 633) were added to the *Witheridge* sub-district, and seven parishes, viz., Burrington, Chulmleigh, George Nympton, King's Nympton, Romansleigh, Satterleigh, and Warkleigh (aggregate population 3,450) were added to the *South Molton* sub-district. The parish of Exmoor (population 313) was taken from the *South Molton* sub-district and constituted a new sub-district called *Exmoor*.
379	WORCESTER - -	1 January -	The sub-districts of *Worcester West* and *Worcester South* were united under the name of *Worcester South-west* (aggregate population 22,942).
461	BOLTON - - -	1 February -	The sub-districts of *Bolton Eastern* and *Bolton Western* were united under the name of *Great Bolton* (aggregate (population 45,694).
561	BELLINGHAM - -	29 April -	The townships of Lecmailing and Nook (population 265) were transferred from the sub-district of *Kirkwhelpington* to that of *Bellingham*.
613	MACHYNLLETH - -	25 April -	The sub-district of *Pennal* was re-named *Towyn*.
628	BANGOR - - -	1 August -	The parish of Llandegai (population 3,587) was transferred from the sub-district of *Bangor* to that of *Llanllechid*, and the parishes of Aber and Llanfairfechan (population 2,483) were transferred from the sub-district of *Llanllechid* to that of *Bangor*.

Under the provisions of "The Divided Parishes and Poor Law Amendment Act, 1876," changes were made on the 25th March 1886 in the constitution of the following Districts, viz. ..—CRANBROOK (52), EAST ASHFORD (55), ELHAM (65), ROMNEY MARSH (66), BATTLE (69), TICEHURST (72), HAVANT (87), ALVERSTOKE (89), FAREHAM (90), FARINGDON (114), WYCOMBE (142), AYLESBURY (143), NEWPORT PAGNELL (145*), THAME (148), WITNEY (153), PETERBOROUGH (167*), LEIGHTON BUZZARD (175*), LINTON (180), NEWMARKET (181), WIMBORNE (261*), SHERBORNE (266*), TOTNES (274), KINGSBRIDGE (275), WILLITON (303*), BRIDGWATER (307*), LANGPORT (308), CHARD (309), WINCANTON (311), SHEPTON MALLETT (313), CLUTTON (316), BATH (317), WHEATENHURST (328), STROUD (329), UTTOXETER (366), MARKET BOSWORTH (405*), GAINSBOROUGH (426), EAST RETFORD (427), BELPER (437), ASHBORNE (438), HUDDERSFIELD (495*), ROTHERHAM (510*), SCARBOROUGH (526), PICKERING (531), GUISBROUGH (533*), BEDALE (537), LEYBURN (538), AYSGARTH (539*), STOCKTON (543), LANCHESTER (548), DURHAM (549), CHESTER-LE-STREET (552), BELLINGHAM (561*), PENRITH (569), CARLISLE (572), and BOOTLE (576*).

* In these cases the limits of sub-districts only are affected.

NOTE.—An addition of territory containing a population of about 8000 was made in 1864, and the facts relating thereto are included in this Table from 1860. Previously to 1st January 1860, children who died within 24 hours after birth were counted as still-born.

* Census year.

† Cholera was epidemic in the year 1853, and war raged in the years 1850 and 1864.

NOTE.—The population in the four years 1862-65 and in the years 1867-69 is estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

* Census year. † Cholera prevailed in 1865-66, and war raged in 1870 and 1871.

NOTE.—The Population enumerated at the Census of 1860 was 15,673,536. The estimated Population for subsequent Years has been deduced from the Excess of Births over Deaths registered in each Year. The facts for the five years 1871-75 were not collected owing to the disturbed state of the country; those for the year 1877 and for the years 1879-86 have not yet been finally dealt with. The decline of registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred during that year.

* Census year.

NOTE.—The numbers for Rome were first included with those for the Kingdom of Italy in 1872. The population figures given for census years show the numbers enumerated on 31st December in each of those years; whereas for each of the other years the population is estimated to the middle of the year. The populations in inter-census years are somewhat over-estimated, no account having been taken of emigration.

* Census year.

NOTE.—For area and population of the Registration Divisions and Counties, *see* pages 64-67.

* The *Registration Counties* consist of groups of Superintendent Registrars' Districts, which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal town of the District, or the greater part of the population, is located. The boundaries of the Registration Counties therefore differ more or less from the boundaries of the Counties (proper).

BIRTHS, DEATHS, and MARRIAGES, registered in the Year 1886—*continued.*

* The 632 *Superintendent Registrars' or Registration Districts* (Paddington 1a and Holyhead 630b having been constituted Superintendent Registrars' Districts since the numerical arrangement 1 to 630 was adopted on 1st January 1881) are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are nearly always identical with the Poor Law Unions of the same names; they are arranged, according to the local position, under the Registration Counties. The Registration Sub-districts (2143 in number at the end of the year 1886) are subdivisions of Registration Districts, within which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union; *w* indicates that a Workhouse Establishment receiving inmates from other Districts than the one in which it stands is included; *H* indicates a Hospital or Infirmary; *L* a Lunatic Asylum; and repetitions of any of these letters show the number of such Institutions in each Registration Sub-district.

† The Deaths in the principal Institutions of England in 1886 are given on pages 71-92.

* The *Registration or Union Counties* consist of groups of Superintendent Registrars' Districts which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal town of the District, or the greater part of the population, is located. The boundaries of Registration Counties therefore differ more or less from the boundaries of Counties (proper).

† These areas, which were partly revised by the Ordnance Survey Department, are the same as those published in the Census Report of 1881. They do not include space occupied by foreshore or tidal water of rivers and creeks.

DEATHS IN WORKHOUSES, HOSPITALS, AND PUBLIC LUNATIC ASYLUMS.

1886.

The following Table shows the numbers of deaths (Persons, Males, and Females) registered during 1886 in the Workhouses, Hospitals, and Public Lunatic Asylums of England. These figures afford the means of correcting the mortality of districts and sub-districts in which these Institutions are situated. The Table includes 1671 Institutions; of which 732 are Workhouses, Workhouse Infirmaries, or Workhouse Schools; 851 Hospitals or Infirmaries; and 88 Lunatic Asylums. The Lunatic Asylums are mostly County Asylums, but a few private Asylums which receive pauper patients (held on that account to be public for the purposes of this Table) are also included. In these 1671 Institutions 57,425 deaths were registered during the year, or 10·7 per cent. of the total deaths in England and Wales, against 10·3 and 10·8 per cent. in the two preceding years; 35,140 occurred in Workhouses, 16,763 in Hospitals, and 5522 in Lunatic Asylums. The proportion to total deaths was 6·6 per cent. in Workhouses, 3·1 in Hospitals, and 1·0 in Lunatic Asylums; the proportion of deaths recorded in Workhouses showed a slight decline from that recorded in the preceding year; the proportion of deaths that occurred in Workhouse establishments was 5·6 per cent. in 1875, after which it steadily increased to 6·7 per cent. in 1885, declining again to 6·6 in 1886.

Information relating to the deaths recorded in many Private Lunatic Asylums, and Private Asylums for Idiots and Imbeciles, will be found in the notes to the following pages.

Deaths in Workhouses, Hospitals, and Public Lunatic Asylums, 1886.

* The deaths of 24 males from Hydrophobia in the year are classed under Zoogenous Diseases in the Table of Causes of Death, p. 108.
† When a person dies from an operation, performed on account of any disease or injury the nature of which is stated in the certificat the death is classed under that disease or injury. The same is done with deaths attributed to Traumatic Tetanus. The figures above ref therefore, only to those deaths from operation and those deaths from Traumatic Tetanus concerning which no further information w obtained.

OF the above 10,812 ACCIDENTS, 102 are stated to have occurred to Persons in a state of INTOXICATI and 2 to Persons suffering from DELIRIUM TREMENS. And in 233 other cases Death was acce rated by the supervention of ERYSIPELAS, MORTIFICATION, PYÆMIA, or TETANUS. Here follow details:—

Causes inducing or accelerating Deaths from Accident.	All Ages.	Total under 1 Year. Infants under 1 Month.	Others.	1–	2–	3–	4–	Total under 5 Years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75–

INDEX OF DISTRICTS.

The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report.* The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 630 in the Abstracts for the year 1881.

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 196) *and "Index of certain Towns"* (page 206).

INDEX OF SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (573; 2) is the 2d Sub-District of the Wigton District, No. 573.]

Sub-District.	District.	No.
A		
Abbey Holme	Wigton	573; 2
Abbots Bromley	Uttoxeter	366; 2
Abbotsbury	Weymouth	264; 4
